As a fan of online clothes shopping, I always feel confused when using Zara's online shopping website. "Why can't I see the full picture of this top?" "Where can I find this and that?" "Why do I even need to see this image if it doesn't help?" So many questions pop up while I browse it. For the final project of this course, I plan to redesign the UI elements and layout of several pages of the Zara online shopping website from a human factors psychology perspective, while still trying to maintain its original style.

The Original Website

1. The main page: The problem is that too many elements have been inserted into it. It is really hard for customers to catch the main point. Also, once the user clicks on certain photos, they are directed to another series of photos. Some of them lead to a product page, while others are not interactive at all.

2. The shopping menu: There are too many categories, and some of them are redundant. There should be some categories that the brand promotes, but they are not highlighted. Also, there are strange landscape photos that do not make much sense.

3. The product list: When users jump into a specific category, like tops, they first see a very large model picture that they cannot view fully at one time. They have to scroll back and forth to check the details. The huge model pictures and different top choices are alternated, which can be confusing. The filter icon is too small to notice.

4. The shopping cart: The layout isn't working well because the only option available to the user is to delete the product. If they want to change the size of the product, they have to go back to the product page. The product name is not fully displayed if it is too long.

REDEGISN ZARA WEBSITE

Terms I Applied

Attention (Week 5 lecture) + Decision Making/Framing (Week 15 lecture): “Focalization, concentration, of consciousness are of its essence. It implies withdrawal from some things in order to deal effectively with others, and is a condition which has a real opposite in the confused, dazed, scatterbrained state which is called distraction...”
Zara’s original design, especially the main page, relies heavily on aesthetic images, but it does not guide users’ selective attention and decision-making clearly. Users may enjoy the visuals, but they might not immediately know where to look, what action to take, or which shopping path to follow. My redesign would use a stronger visual hierarchy, clearer navigation, and more visible call-to-action buttons to direct attention toward the important elements. At the same time, buttons and labels such as “Best Sellers” and “What’s New” frame the user’s choices in a simpler way, which will help users focus more effectively, reduce distractions, and make decisions more easily.

Working Memory Capacity (Week 7 lecture): Zara’s original product pages sometimes require users to search across different sections of the website for information, which can increase working memory demands because users have to temporarily hold information in mind while navigating the page. Since working memory is limited, my redesign plan is to place key information in one clear, organized section, which can make the shopping process smoother and help users compare options more easily.

My Design

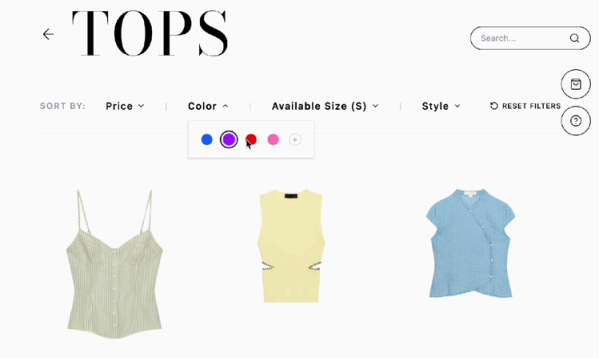

Main page: It should showcase the brand’s value and style to help customers decide whether to keep browsing. So here, I removed all unnecessary pictures and details from the original Zara website to highlight its representative style, slogan, and brand name.

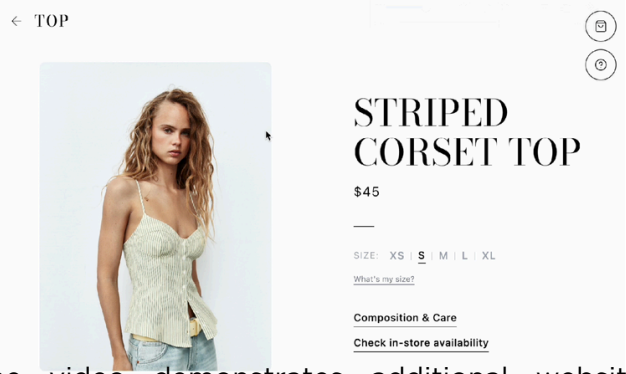

Menu: There should be more categories, but this redesign mainly shows the logic and priority of labels. If users are targeting a certain category, they should be able to go directly to it. If they are browsing the website, they should also immediately see what they can look at.
.

The page for a specific category is more direct than the original. Customers can see all products in the category they choose, and use filters that can be reset whenever they want to refresh their search.

The product page is more straightforward. It only contains necessary options and size references.

The video demonstrates additional website features, including the shopping cart and search.
